CLASS PRACTICE DENSITY NOTES **Use THIS to help you with your homework page.

$$volume = length \times width \times height$$
 Label cm³
 $density = \frac{m}{v}$ Label g/cm³

- 1. An iron cube measures 5cm X 5cm X 5cm. What is its volume?
- 2. If the same iron cube's mass is 3.2kg, what is its density in q/cm³?
- 3. What is the **density** of a block of chocolate measuring 3cm X 4cm X 1cm, with a mass of 6q?
- 4. What is the density of a block of wood measuring 0.6cm X 3cm X 8cm with a mass of 8.4q?
- 5. What has the greater density, a cube of water measuring 2cm X 2cm X 2cm and having a mass of 8g, or a block of plastic measuring 2cm X 3cm X 5cm with a mass of 4g?
- 6. What is the density of a cube of paper measuring 7cm on each side and its mass is 82g?

Water has a density of approximately $1q/cm^3$. In fact $1cm^3$ of water used to be the standard for a gram. Objects will sink if their density is greater that water and will float if their density is less. For the following problems, decide if the block will sink or float.

- 7. A cube measuring 5cm on each side and its mass is 25g; will it sink or float?
- 8. A block has a mass of 45g and measures 4cm X 2cm X 4cm; will it sink or float?
- 9. A hollow iron cube has measures 4cm on each side and has a mass of 30g. Will the iron cube sink or float?
- 10. A cube made of very old hard wood, has a mass of 68g and measures 9cm a side, will it sink or float?
