

# A MATTER OF MATTER

You're surrounded! Everything around you is matter because matter is anything that has mass and takes up space. You've learned about the three ordinary states of matter. The difference between these states has to do with how tightly particles are packed together and how they move.

1. Name and describe the three ordinary forms of matter below. Label each circle with its form. Then write a description of the characteristics of each state, and tell something about the motion of the molecules.
